Penjelasan Source Code

```
function calculateResult() {
    try {
        currentInput = eval(currentInput).toString();
        screen.value = currentInput;
    } catch (error) {
        screen.value = "Error";
        currentInput = "";
    }
}
```

eval(currentInput): Menghitung ekspresi matematika yang ada dalam variabel currentInput.
screen.value = currentInput; Menampilkan hasil perhitungan ke layar (input dengan class screen).
catch (error): Jika terjadi kesalahan dalam perhitungan. misalnya pengguna memasukkan format yang salah layar akan menampilkan "Error".

```
<button class="equal" onclick="calculateResult()">=</button>
```

Kode ini adalah tombol "=" yang memanggil fungsi calculateResult() saat diklik.
